# RARS

## Risk Assessment & Routing System

## An introduction for TechServe & DCOPS

*Follow one real request — from “I need access” to “access granted”*

Megaworld Corporation · Information Security Management (ISM)

Kai Justin Tan

MEGAWORLD

# Why was RARS made?

**The request:** Maria Santos (Marketing) needs to share qualified buyer-leads — names, contact numbers & emails — with a partner bank's agency for a co-marketing campaign. Sharing personal data with an external third party falls under the Data Privacy Act (RA 10173).

## THE OLD PROCESS

- Email IT, attach a form
- Forward to each approver by hand
- Chase replies one by one
- Track it all in your inbox

## WHY IT HURT

- Emails get buried — requests slip
- Endless back-and-forth on errors
- No one knows who already approved
- No privacy check, no audit trail

## HOW RARS FIXES IT

- Routed to the right people, in order
- Errors returned with a clear reason
- Every approval logged & visible
- Privacy-checked (PIA) before routing

MEGAWORLD

# How does RARS work?

It starts with two forms — the request (DCS), then the privacy check (PIA).

## 1 DCS — the request

Data Collection System · what you're asked

- Your details: name, office, department
- Access type: Internal or External
- Involves: None / Agency / OJT
- Accountable persons (up to 5)
- Approver emails: Immediate & Dept Head
- Required documents (per request type)

**In short:** who you are, what access you need, and the papers that back it up.

## 2 PIA — the privacy check

Privacy Impact Assessment · 7 guided steps

- Compliance checklist & consent
- Program info (auto-filled from DCS)
- PII inventory — pick data types (≥3)
- Internal / external stakeholders
- Information flow: collect → use → dispose
- Review summary, then submit

**In short:** what personal data is touched, how it flows, and its risk level.

MEGAWORLD

# Who approves it — and who decides where it goes?

The request climbs one step at a time — each approver acts in turn.

**1** → **Immediate Head**
*chosen by the requestor*

**2** → **Department Head**
*chosen by the requestor*

**3** → **InfoSec × 2**
*Ms. Christine → Sir Darwin*

**4** **Division Head**
*only if escalated*

## InfoSec also decides the routing

They send it to **DCOPS**, **TechServe**, or **Both**. Sir Darwin has the final say — if Ms. Christine picks DCOPS but Sir Darwin picks TechServe, it goes to TechServe.

## Automatic emails

- The system emails each approver when it's their turn and keeps Maria updated at every stage.
- Approver is emailed daily until approved.

**Note:** Immediate Head and Department Head are the approvers the requestor named on the DCS form. InfoSec (Ms. Christine, then Sir Darwin) reviews the privacy risk before anything is routed.

MEGAWORLD

# What if it isn’t a clean “yes”?

## Returned

Sent back for fixes. Maria edits & resubmits — and review starts over from step one. (Fixable, but back to square one.)

## Denied

Rejected and closed. She’d have to file a brand-new request. (Final.)

## Escalated

Bumped up to a Division Head for a call, then comes back down the ladder.

MARIA IS ONE OF SEVERAL REQUESTER TYPES — EACH WITH ITS OWN PAPERS

### Standard

*e.g. Maria*

Regular employee.

**Scenario:** Internal access → DPA. External (Maria’s) → NDA + DSA.

### Agency

*third-party staff*

Outside personnel on contract.

**Scenario:** e.g. a vendor engineer → Agency Endorsement Letter + Confidentiality Undertaking.

### OJT

*interns*

Students on practicum.

**Scenario:** e.g. a CS intern → School Endorsement Letter + Confidentiality Undertaking.

***Takeaway:*** *a request only reaches your team if it survived all of this — so what you receive is genuinely final.*

MEGAWORLD

# So, where do you come in?

**By the time it reaches you, Maria's request is fully approved.** RARS generates a Certificate of Approval, routes it to TechServe / DCOPS, and notifies you of this via email, every supporting document listed. Your job: provision the access.

## WHAT'S IN IT FOR YOU

### No guesswork
Already reviewed & approved by the right people.

### Privacy pre-checked
The PIA caught the compliance angle — not you.

### Full audit trail
Who asked, who approved, when & why — all logged.

### Clear routing
You only get what's meant for you.

*Reviewed by the right people · privacy-checked · approved up a proper chain · fully logged — before it ever reaches you.*
