RARS Presentation

Presenter Script — Slide by Slide

For: TechServe & DCOPS · Information Security Management (ISM)

How to use this script

Read the bold sections aloud as written. The italic tips and [PAUSE] markers are for you, not the audience — they're reminders on pacing and emphasis. You don't need to memorise this word for word; use it as a guide and speak naturally.

Total estimated time: 10–15 minutes.

SLIDE 1

RARS — Title Slide

Suggested time: ~1 minute

WHAT TO SAY

> "Good morning / afternoon, everyone. My name is [your name], and I'm part of the Information Security Management team here at Megaworld."
>
> "Today we're going to walk you through RARS — the Risk Assessment and Routing System. This is the system that handles all data-access requests before they reach your team."
>
> "What I want to do is follow one real request — from start to finish — so by the end of this, you'll understand exactly what happens before anything lands in your queue."
>
> "Let's start with the question that created RARS in the first place."
>
> **[PAUSE]** *Click to advance to Slide 2. Let the title sit for a beat — don't rush past it.*
>
> **TIP** *If it's a small group, introduce yourself more casually. The key thing to land on is the last line — set up the Q&A format.*

SLIDE 2

Why was RARS made?

Suggested time: ~2–3 minutes

SET UP THE SCENARIO FIRST

"Before RARS existed, here's how a data-access request would have worked. Meet Maria Santos, from Marketing."

"Maria needs to share a list of qualified buyer-leads — names, contact numbers, and emails — with a partner bank's agency, for a co-marketing campaign. Sounds straightforward, right? But she's sharing personal data with an external third party. That falls under the Data Privacy Act — RA 10173. So this isn't something you can just attach to an email and send."

[PAUSE] *Point to the request strip on screen.*

WALK THE THREE COLUMNS

"So what did the old process look like?"

"Maria emails IT. Maybe she attaches a form — maybe she doesn't. She manually forwards it to each approver. She chases replies one by one. She tracks everything in her inbox."

"And that created real problems. Emails get buried. Requests slip through the cracks. There's no record of who already approved what. And critically — there's no privacy check anywhere in the process. No one was making sure the right eyes were reviewing the right things."

[PAUSE] *Pause here — let 'no privacy check' land.*

"That's where RARS comes in. Now Maria's request gets routed to the right people in order. If something's wrong, it comes back to her with a clear reason — not just radio silence. Every approval is logged and visible. And before anything is routed to your team, it's already been through a formal privacy assessment."

TIP *The three-column layout on screen tells this story visually. You can point left to right as you speak — old way, problems, fix.*

SLIDE 3

How does RARS work?

Suggested time: ~2–3 minutes

INTRODUCE THE TWO FORMS

"Okay, so how does the process actually work? It starts with two forms."

"The first is called the DCS — Data Collection System. This is Phase 1. It's the actual request form. Here's what Maria fills in."

[PAUSE] *Point to the left card.*

WALK THROUGH DCS

"She enters her basic details — full name, office, department. She picks the access type: Internal, meaning within the company, or External, meaning a third party is involved, like in Maria's case."

"She also selects what kind of request this is — Standard, Agency, or OJT. We'll come back to those in a moment."

"Then she adds up to five accountable persons — the people responsible for this data. She enters the email addresses of her approvers: her Immediate Head and Department Head."

"Finally, she uploads the required documents. The specific forms depend on her selections — but for Maria, since it's an external request, she needs an NDA and a Data Sharing Agreement, or DSA."

"In short: the DCS is who you are, what access you need, and the papers that back it up."

[PAUSE] *Pause after the 'In short' line — it's a summary moment.*

WALK THROUGH PIA

"Once the DCS is submitted, Maria is directed to Phase 2 — the PIA. Privacy Impact Assessment."

[PAUSE] *Point to the right card.*

"This is a seven-step guided form. It takes Maria through a compliance checklist, captures program information — which is actually auto-filled from her DCS so she doesn't re-enter it — and then asks her to inventory the personal data involved. She has to pick at least three data types."

"She then documents the stakeholders and maps the information flow: how data is collected, used, retained, and disposed of."

"The last step is a full review, and then she submits."

"In short: the PIA is what personal data is touched, how it flows, and what the risk level is."

TIP *Emphasise that nothing is granted at this point. Both forms just document the request — the real decision happens in the next step.*

"At this point, all Maria has done is documented her request. Nothing has been approved yet. That's next."

SLIDE 4

Who approves it — and who decides where it goes?

Suggested time: ~2–3 minutes

INTRODUCE THE LADDER

"Once the PIA is submitted, the approval ladder activates. Maria's request climbs one step at a time."

[PAUSE] *Point to each step as you name it.*

"First: her Immediate Head. Second: her Department Head. These two — and this is important — were chosen by Maria herself when she filled out the DCS form. She named them. So these aren't random approvers; they're the people she works with directly."

"Third: InfoSec. Specifically, two members of our team review it — sequentially, not simultaneously. That's Ms. Christine first, then Sir Darwin."

"And fourth, Division Head — but only if the case gets escalated. That's the exception, not the rule."

ROUTING — DARWIN'S FINAL SAY

"Now here's where it gets specific to your team. InfoSec doesn't just approve or deny — they also decide where the request gets routed."

[PAUSE] *Point to the navy routing card.*

"They choose: DCOPS, TechServe, or both. And this is important: Sir Darwin has the final say. If Ms. Christine selects DCOPS, but Sir Darwin selects TechServe — the request goes to TechServe. His decision is what counts."

TIP *Pause and check understanding here — this is often the detail people want to confirm.*

AUTOMATIC EMAILS

> "Throughout this whole process, the system sends automatic emails. Each approver gets notified when it's their turn. Maria gets updated at every stage — progressing, returned, denied, approved. Nobody needs to manually follow up."
>
> "And just so you know — if an approver doesn't act, the system sends them a daily reminder until they do. No request goes silently abandoned."

SLIDE 5

What if it isn't a clean 'yes'?

Suggested time: ~2 minutes

"Not every request sails straight through. There are three other outcomes besides a clean approval, and each one works differently."

[Point to Returned.]

RETURNED — Scenario:

"Let's say Maria submitted her DCS and PIA, and her Immediate Head notices that the Data Sharing Agreement she uploaded is missing a signature. The Immediate Head marks it as Returned and writes the reason in the system."

"Maria gets an email immediately — 'Your request has been returned. Reason: DSA is incomplete.' She goes back, gets the signed copy, re-uploads it, and resubmits."

"But here's the critical thing: it doesn't continue from where it left off. The ladder resets completely. Her Immediate Head has to review it again from Step 1. Then Department Head again. Then InfoSec again. Every approver reviews it as if it's a fresh submission. Back to square one."

[Pause. This is the detail people always remember.]

[Point to Denied.]

DENIED — Scenario:

"Now let's say InfoSec reviews Maria's request and determines that the data sharing arrangement doesn't meet compliance requirements under the DPA — for example, the partner agency hasn't signed a proper data processing agreement, and the purpose isn't sufficiently justified."

"InfoSec marks it Denied, provides the reason, and the case is closed. Maria gets a notification: 'Your request has been denied.' There is no appeal path within the same request. If Maria believes she can address the issue, she would need to file a completely new request from scratch."

"Denied is final."

[Point to Escalated.]

ESCALATED — Scenario:

"Now imagine Maria's request involves a higher-risk category of data — say, the lead list includes health or financial information in addition to contact details. InfoSec reviews it and determines this is beyond the standard approval scope. It needs a judgment call from a higher authority."

"InfoSec escalates the request to the Division Head. The Division Head reviews, makes a decision, and the case comes back down. If the Division Head approves, it continues through the normal process from that point. If not, it may be returned or denied."

[Pause and transition.]

"Now — Maria is a regular employee making a standard external request. But she's just one of three types of requestors that RARS handles. Each type has different document requirements."

[Point to Standard.]

STANDARD — Scenario:

"Maria is the standard type. Regular employee. Her request is External, so she needs an NDA and a Data Sharing Agreement. If it had been an internal request — say, she just needed access to a shared internal drive — she would only need a Data Protection Agreement, or DPA."

[Point to Agency.]

AGENCY — Scenario:

"Say a third-party vendor is doing IT work for Megaworld and needs access to certain systems during their engagement. That vendor's personnel would submit an Agency request. They need two documents: an Agency Endorsement Letter — signed by whoever in Megaworld is responsible for the engagement — and a Confidentiality Undertaking. Without both, the request cannot proceed."

[Point to OJT.]

OJT — Scenario:

"A Computer Science intern from a partner university is doing their practicum at Megaworld and needs access to certain internal tools. They submit an OJT request. They need a School Endorsement Letter — issued by their university — and a Confidentiality Undertaking. The endorsement letter label on the form actually changes automatically based on whether they selected Agency or OJT."

"The takeaway from all of this: a request only reaches your team if it has survived every single one of these steps. What lands in your queue is genuinely final."

THE PUNCHLINE

> "The takeaway from all of this: by the time a request reaches your team, it has survived every single one of these steps. What you receive is genuinely final."
>
> **TIP** *Say this last line slowly and clearly. It's the bridge into Slide 6.*

SLIDE 6

So, where do you come in?

Suggested time: ~1–2 minutes

LAND THE CONCLUSION

"By the time Maria's request reaches TechServe or DCOPS, it's fully approved. The system has already generated a Certificate of Approval, routed it to the right team — your team — and notified you with every supporting document listed."

"Your job at that point is one thing: provision the access."

[PAUSE] *Let that land. Don't rush into the cards.*

WALK THE FOUR CARDS

"No guesswork — everything has already been reviewed and approved by the right people. You don't need to second-guess the request."

"Privacy pre-checked — the PIA caught the compliance angle. You didn't have to do that. That work is already done."

"Full audit trail — who asked, who approved, when, and why. It's all logged. If anyone questions it later, you're covered."

"Clear routing — you only get what's meant for you. Nothing lands on your desk by accident."

CLOSE

"So that's RARS — reviewed by the right people, privacy-checked, approved up a proper chain, and fully logged — before it ever reaches you."

"We're happy to take any questions now, or if you want to look at a specific scenario, we can walk through that too."

TIP *If time allows, offer to walk through a live or demo request so they see the system firsthand. That tends to be more memorable than the slides alone.*

Quick Reference — Key Details

Keep this section handy for questions from the floor.

APPROVAL LADDER

- Step 1 — Immediate Head (named by the requestor on the DCS form)
- Step 2 — Department Head (named by the requestor on the DCS form)

- Step 3 — InfoSec: Ms. Christine first, then Sir Darwin
- Step 4 — Division Head (only if escalated by InfoSec)
- Sir Darwin has the final routing decision — his choice wins

DOCUMENT REQUIREMENTS

- Standard / Internal → Data Protection Agreement (DPA)
- Standard / External → NDA + Data Sharing Agreement (DSA)
- Agency → Agency Endorsement Letter + Confidentiality Undertaking
- OJT → School Endorsement Letter + Confidentiality Undertaking

KEY TERMS

- DCS — Data Collection System (Phase 1: the request form)
- PIA — Privacy Impact Assessment (Phase 2: 7-step privacy check)
- RA 10173 — Data Privacy Act of the Philippines
- HMAC — How the system secures approval links (tamper-proof)
- Certificate of Approval — what the system generates on full approval and routes to your team

IF ASKED: WHAT HAPPENS TO A RETURNED REQUEST?

The ladder restarts completely from Step 1. The Immediate Head reviews again — every approver must re-act. Nothing carries over.

IF ASKED: WHAT IF BOTH INFOSEC MEMBERS PICK DIFFERENT ROUTES?

Sir Darwin's selection takes effect. His is always the deciding vote.
